

## The tasks of the second week of the industrial engineering track

### **Requirements:**

I would like the robot to provide me with information about the company and the most important achievements and some of its industries.

### **Design:**

The robot consists of a complete and integrated structure starting from the head to a small screen displaying the features of the robot "eyes and mouth"

The body will have a mid-sized screen displaying the information.

Two arms and two men are equipped with disbands from both sides to facilitate movement.

Test operations on Android:

The test was conducted on the first parts of the robot and Hai legs and the focus was on the Suspension system and the elasticity of the joints and their ability to bump.

I appreciate saying that almost the first experiments of the elaborate feet did well, but the tests are still early.
